

CareBridge Nurse & Allied Healthcare Professional Portal

Registration, Dashboard Access & Security Requirements

Purpose

This document defines the functional, access control and security requirements for the CareBridge Nurse & Allied Healthcare Professional Portal. It ensures secure onboarding, role-based permissions and protection of professional and patient information.

1. Registration

Healthcare professionals shall register using their personal and professional information, including Full Name, CNIC, Mobile Number, Email Address, Password, Registration Number and Professional Category.

2. Verification Documents

Applicants shall upload their Professional Registration Certificate or License together with CNIC (Front and Back). Documents shall only be visible to authorized users for verification purposes.

3. Registration Workflow

Complete the registration form, upload required documents, submit the application, undergo verification by the Super Admin, receive approval and gain access to the dashboard.

4. Dashboard Access

Approved users may access Dashboard, Create Referral, Emergency Referral, My Referrals, Patient Tracking, Wallet & Earnings, Withdrawal Requests, Notifications, Analytics and Profile Settings according to assigned permissions.

5. Profile Security

Every Nurse and Allied Healthcare Professional profile shall be individually password protected. Whenever an administrator attempts to access a profile, password authentication shall be required. Only the Platform Super Admin may view registration details, personal information, registration certificates, CNIC documents, uploaded files, wallet information, profile settings and referral history. Once updates are completed, the profile shall be locked again.

6. Referral Record Security

After a referred patient has been discharged, the referral record shall automatically become password protected. Viewing patient information, discharge summaries, referral history, uploaded reports and confidential medical information shall require password authentication. Only the Platform Super Admin may unlock these records and must re-lock them after completing the required work.

7. Hospital-Level Security

Each participating hospital shall have its own Hospital Super Admin. The Hospital Super Admin may assign password protection to Nurse profiles, Technician profiles and Hospital Team Member accounts. Hospital staff shall not be able to view confidential information or documents without authorization.

8. Role-Based Access Control

Platform Super Admins have full system access. Hospital Super Admins manage users and permissions within their hospitals. Admin Team members perform operational tasks only and cannot access protected information. Nurses and Allied Healthcare Professionals may access only their own profiles, referrals, wallets and assigned functions.

9. Technical Security Requirements

The system shall implement encrypted password storage, individual password protection for every profile, encrypted document storage, password-protected referral records, secure backend API authorization, audit logs, automatic session timeout, profile re-locking after use and optional two-factor authentication for privileged users.

Benefits

The proposed security model protects confidential professional and patient information, prevents unauthorized access, strengthens role-based permissions, improves auditability, supports healthcare compliance and provides consistent security across all CareBridge portals.
