

Secure Profile Access Control Requirements

Purpose

To enhance data privacy and strengthen system security, access to sensitive Consultant, Hospital, Laboratory and Referral information should be restricted exclusively to authorized users. This functionality ensures that confidential information, certificates, patient records and system configurations remain protected from unauthorized access.

1. Consultant (Doctor) Profile Security

Each consultant profile shall have an individual password managed by the Super Admin. Opening a profile must display a password prompt. Only the Super Admin may view or edit consultant applications, personal information, contact details, PMDC certificates, calculator settings, uploaded documents and other confidential information. After updates are completed, the profile should be locked again. Other administrative users must not be able to access consultant details.

2. Hospital Profile Security

Every hospital profile shall use the same password protection mechanism. Passwords will be managed by the Hospital Portal Super Admin. Hospital administrative users must not be able to access confidential hospital information, consultants, certificates or documents unless authorized. Profiles should be re-locked after updates.

3. Laboratory Profile Security

Laboratory profiles must also be password protected. Only the Super Admin may access confidential laboratory information, doctor certificates and uploaded documents.

4. Super Admin Control Panel

Provide a centralized module allowing the Super Admin to create, update and reset passwords for Consultant, Hospital and Laboratory profiles. The workflow should allow unlock, update and immediate re-locking.

5. Referral Module Security

After a referred patient is discharged, the referral record should automatically become password protected. Viewing patient referral details, medical history, diagnosis, discharge summary or uploaded documents should require password authentication. Only the authorized Super Admin may unlock and re-lock the record.

6. Hospital-Level Administrative Security

Each Hospital should have its own Hospital Super Admin who can assign passwords to individual consultant profiles and hospital team members. This ensures departmental staff cannot view confidential consultant information, profile changes, certificates, calculator settings or sensitive documents without authorization. The Hospital Super Admin may unlock, manage and re-lock profiles whenever necessary.

Expected Benefits

Prevent unauthorized access to confidential information, strengthen role-based access control, protect patient, consultant, hospital and laboratory records, and improve compliance and audit readiness.

Technical Requirements

Add password_protected and encrypted profile_password fields, display a password verification dialog before opening protected records, restrict backend APIs for unauthorized users, provide a Lock Profile option, store passwords securely using hashing and maintain audit logs for unlocks and changes.
